"A Transistorized Key Operating Into an Inductive Load"

USSR Author's Certificate No 2732279 [sic], filed 27 Jan 69, published  
28 Aug 70 (from RZh-Radiotekhnika, No 2, Feb 71, Abstract No 2G293 P)

Translation: This Author's Certificate introduces a key which operates into an inductive load connected in the collector circuit of a transistor. To improve reliability and eliminate an auxiliary power supply, the device contains an additional transistorized key stage with inductance in the collector circuit, the main inductive load being connected through a semiconductor diode to the collector of the additional stage and to a power supply terminal.

"An Electrolyte for Cadmium Plating"

Author's Certificate No 346390, filed 10 Sep 70, published 22 Aug 72 (from  
Referativnyy Zhurnal — Khimiya, No 8(II), 1973, Abstract No 8L3C7P)

Translation: An ammonium chloride electrolyte is patented for cadmium plating. It is improved in that in order to prevent the hydrogenation of the base metal, ethylene glycol is added, resulting in the following composition, in g/liter: CdCl<sub>2</sub>, 40-50; NH<sub>4</sub>Cl, 230-280; ethylene glycol, 30-40, carpenter's glue, 1-2; an optimum pH of the electrolyte of 2.5-3.5; D<sub>k</sub> less than 2 amps/decimeter<sup>2</sup>, and a theoretical yield of 100%. For example, samples from the steel EI-643 having a notch r=0.1 mm is plated with cadmium in our electrolyte having the following composition, in g/liter: CdSO<sub>4</sub>, 50; NH<sub>4</sub>Cl, 250; ethylene glycol, 30; carpenters glue, 2; at pH of 3.0 and a D<sub>k</sub> 2 amps/decimeter<sup>2</sup> for a thickness of 10 microns. Without subsequent heating at a tension equal to 90% of the strength of the notched sample (the Stress equals 216 kg/m<sup>2</sup>), the plated sample did not fracture after 200 hours.

"Serum Cholinesterase Activity in Patients with Hemorrhagic Fever  
with a Renal Syndrome"

Moscow, Laboratornoye Delo, No 1, 1970, pp 49-50

Abstract: Study of the dynamics of serum cholinesterase activity in 88 patients with hemorrhagic fever with a renal syndrome showed that cholinesterase activity decreased as the disease progressed. The degree of decrease in enzyme activity was directly proportional to the severity of the course of the disease. The test can be used as a means of evaluating the effectiveness of therapy.

"A Comment on a Theorem of V. S. Mikhalevich"

Zap. Nauch. Seminarov Leningr. Otd. Mat. In-ta AN SSSR [Writings of Scientific Seminars of Leningrad Division Mathematic Institute, Academy of Sciences, USSR], 1972, Vol 29, pp 14-17 (Translated from Referativnyy Zhurnal, Kibernetika, No 1, 1973, Abstract No 1 V183 by A. Novikov).

Translation: The problem is studied of sufficient statistics for a set of time-homogeneous random processes with independent increments, the measures of which are mutually absolutely continuous. The theorem of Mikhalevich (RZhMat, 1963, SV168) gives a necessary and sufficient condition for these processes for the value of the process at the last moment in time to sufficient statistics. It is shown in this work that if only processes with purely continuous Poisson spectrum are studied, the value of the process at the last moment in time is always a sufficient statistics for them.

III. SHOCK WAVES IN LIQUIDS

Antrankin, E. I., V. K. Bobylev, and  
A. V. Dubovik. Collapse of an elliptic  
cavity and explosive initiation in a  
liquid layer under shock effect. ZIFMFTF,  
no. 5, 1971; 78-85.

Analytical and experimental results are given on the effect of shock excitation of a combustible liquid volume. Criteria are developed for the threshold conditions under which a nominally spherical fluid volume shifts to an elliptical form, and on further compression develops into a cumulative jet; in the limit this results in detonation from adiabatic heating of gas evolved in the volume. Test data on shock generation of jets in liquid nitroglycerine are included, and show qualitative agreement with theoretical results.

Shtessel', E. A., K. B. Pribytova, and  
A. G. Merchanov. A numerical solution  
to the problem of a thermal explosion with  
free convection taken into account. FGIV,  
no. 2, 1971, 167-178.

The authors cite previous works in which the effect of free convection on a gas explosion process is expressed in terms of the Rayleigh (Ra) and Frank-Kamenetsky (δ) criteria. The analysis is extended here to the case of liquid fuel combustion, and is presented as a supplement to earlier experimental work by Merchanov and Shtessel' (FGIV, no. 1, 1971) in which an empirical correlation between Ra and δ was obtained. The model used assumes an ideal stationary fluid in a uniform semi-infinite vessel; gas evolution is neglected. The results are shown graphically, indicating the conditions under which convection will or will not affect the detonation process.

"On the Effect of Natural Convection on the Ignition of Liquid Systems"

V sb. Gorenije i vzryv (Combustion and Explosion -- Collection of Works),  
Moscow, "Nauka", 1972, pp 24-29 (from RZh-Mekhanika, No 3, Mar 73, Abstract  
No 38932)

Translation: An approximate theoretical analysis is presented of the phenomenon of ignition considering natural convection. A layer of sufficiently great depth that is infinite in the horizontal direction is considered. Emission is carried out by heating from below under two types of boundary conditions:  
(a) at a constant temperature of the surface in the course of the process, and  
(b) under a constant thermal flow. The system of equations of motion, energy, and continuity is investigated. As a result of the physical assumptions made, it is possible to solve the problem by the method of consecutive approximations using the method of integral relationships. Analytical functions showing the lag time as a function of the Reynolds number characterizing the convection intensity and the Prandtl number are obtained for two types of boundary conditions. Several features in the combustion process involved in the natural convection developed are discussed. Authors' abstract.

"High-Frequency Silicon Photodiodes With PIN-Junction Structure"

Moscow, Radiotekhnika i Elektronika, vol 16, No 11, Nov 71, pp 2232-2234

Abstract: Silicon photodiodes are described in which speed is increased at high inverse bias voltages by eliminating the diffusion time and reducing RC parameters. The diodes are made from high-resistance P-silicon (resistivity of 1000-2000  $\Omega\cdot\text{cm}$ ). Curves are given for the frequency response of the diodes for incident radiation on wavelengths of 0.63 and 0.91  $\mu$  at various supply voltages from 0 to 100 V. The spectral characteristics of the photodiode are given as well as a structural schematic. The proposed photodiodes can be used in high-quality optico-electronic equipment in combination with various radiation sources. Particularly promising is the use of these diodes in semiconductor devices in conjunction with gallium arsenide emitters. The authors thank M. Kh. Kol-lender for her assistance with preparation of the diodes. Two figures, bibliography of two titles.

"Dependence of Photodiode Sensitivity and Inertia on the Dimensions and Position of a Light Spot on the Light-Sensitive Area"

Kiev, Izvestiya VUZ--Radioelektronika, Vol 14, No 1, 1971, pp 72-75

**Abstract:** The results of investigations into the possibility of increasing the sensitivity and rapidity of action of photosensitive diodes with the use of a focusing system are given. In general, the sensitivity and inertia of the diode depend on the thickness of the photosensitive base, the surface recombination rate at the illuminated point on the base, and the absorption factor for a particular optical wavelength. Since the diffusion length of the minority carriers is much larger than the base thickness, the space recombination can be neglected. A relief diagram of the sensitivity and inertia values at the central part of the base in a type 1690 photodiode is shown; the light used to obtain these results had a wavelength of  $0.63\text{ }\mu$ , the diameter of the light spot was about  $50\text{ }\mu$ , and the distance between the centers of the relief squares was  $100\text{ }\mu$ . Curves are plotted for diode characteristics as functions of light spot diameter.

"Radiation Annealing of Defects Formed During Ion Bombardment of Crystals"

Leningrad, Fizika i Tekhnika Poluprovodnikov, Vol 6, No 9, Sep 72, pp 1834-1835

**Abstract:** The authors investigate the recovery of gallium arsenide and silicon structures amorphized by bombardment with 40 keV argon ions. The annealing was accompanied by irradiation with 3.5 MeV electrons or 10 keV protons. The three procedures used for checking structural transformations are described. It was found that defects induced by argon ion bombardment were not removed by heating at 200-250°C without proton irradiation. A temperature of 500°C is required without the proton treatment. When proton bombardment is used, the lower temperature is sufficient for recovery of the nondefective structure. The authors thank S. I. Romanov for taking the electron-diffraction patterns of the surface of the specimens, and B. I. Vikhrev for measuring the electron paramagnetic resonance.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. EXPERIMENTAL STUDY IN WHICH CONDUCTING FILMS WERE SYNTHESIZED ON SEMIINSULATING GALLIUM ARSENIDE BY BOMBARDMENT WITH XENON, KRYPTON, SELENIUM, AND ZINC IONS. THE CARRIER CONCENTRATION IN THE FILM IS 5 TIMES 10 TO THE 16TH PER CU CM, THE MOBILITY IS 10 SO CM-V SEC, AND THE THERMAL ACTIVATION ENERGY IS 0.07 EV. THE EFFECT OF THE DOSE RATE, THE ION ENERGY, AND THE SUBSTRATE TEMPERATURE ON THE FORMATION OF THE CONDUCTING FILM IS INVESTIGATED. WITH THE AID OF AN ETCHANT ACTING AT A RATE OF 5 TO 8 A-SEC, THE DISTRIBUTION OF THE FILM CONDUCTIVITY WITH DEPTH IS RECORDED. ON THE BASIS OF EXPERIMENTS ON ION BOMBARDMENT AND IRRADIATION OF SEMIINSULATING GAAS WITH REACTOR NEUTRONS AND ELECTRONS WITH AN ENERGY OF 3.5 MEV, IT IS CONCLUDED THAT AN INCREASE IN CONDUCTIVITY IS ATTRIBUTABLE MAINLY TO A MERGING OF THE BIAS PEAKS INTO A SINGLE FILM WHERE THE COMPENSATION CONDITIONS ARE NOT FULFILLED.

"Radiolysis of Polysiloxane Resin"

Moscow, Plasticheskiye Massy, No 3, 1971, pp 24-26

**Abstract:** Structural rearrangements occurring in solidified silicon organic resin under the influence of ionizing radiation were studied by IR spectroscopy, mass-spectroscopy, thermomechanical, and physicomechanical techniques. Polymethylsiloxane resin is formed by cohydrolysis of methyltrichlorosilane and dimethyldichlorosilane yielding cyclic polymers with silsesquioxane bonds. It was determined that radiation leads to further structuralization of already solidified polymer. This is due to the formation of new  $\Sigma$ Si-O-Si $\Sigma$  bonds, methylene and ethylene bridges and changes in the cyclic structure pattern of the polymer. These polymers become more durable because of the disappearance of organic radicals and increase in the number of trimer cycles. Temperature increase during radiolysis enhances the rate and degree of these processes.

Moscow, Metallovedeniye i Termicheskaya Obrabotka Metallov, No 9, 1970,  
pp. 64-66

**Abstract:** The dependence of the optimal degree of deformation during high-temperature thermomechanical treatment of chrome-manganese-silicon steel on carbon content was determined on four melts of type 30KhGSA steel containing 0.29, 0.39, 0.48, and 0.58% carbon. Deformation by rolling was 30, 60, and 90%. The billets were austenitized at 1000°C, and hardened after deformation from 900°C. The mechanical properties were determined in specimens tempered at 200°C for one hour. The optimal degree of deformation was found to decrease with increasing carbon content in the steel. The dependence of  $\epsilon_{opt}$  on carbon content allows the optimal degree of deformation of austenite to be determined for chromansil steel of any composition. A figure is presented illustrating the dependence of optimal degree of deformation on carbon content.

pp 457-459

The synthesis is based on methyl 8-cyanoctanoate (III). It was assumed at first that ester (III) could be converted to hydroxy ketone (IV) with excess methylmagnesium iodide. However, even a reagent ratio of 1:10 failed to give the desired result. Careful selection of reaction conditions showed that ester (III) reacts with three moles of methylmagnesium iodide to form hydroxy nitrile (V) which is converted to unsaturated nitrile (VI) after dehydration without filtering. Reaction of (VI) with four moles of methylmagnesium iodide yields ketone (VII) which is converted to the diene ester (VIII) by the Whittig reaction. Compound (II) is obtained by bubbling hydrogen chloride through an alcohol solution of diene ester (VIII). Tests on mosquito larvae showed that (II) is as active physiologically as compound (IX), which is called "synthetic juvenile hormone."

XII. EQUATIONS OF STATE

Pridatchenko, Yu. V. and Yu. I. Shimakov.  
Rheological equations of state for weak polymer  
solutions with rigid ellipsoidal macromolecules.  
ZhPMTF, no. 2, 1972, 125-129.

Results obtained by Shimakov and Taran (I-FZh, v. 18, no. 6, 1970) are generalized by taking macromolecular inertia and the effects of external electric and magnetic force fields into account when deriving rheological equations of state for weak polymer solutions with rigid ellipsoidal macromolecules and macromolecular Brownian motion. The effects of macromolecular inertia on the rheological properties of liquids are analyzed. Using Jeffery's expressions for flow perturbation caused by a suspended rigid ellipsoid in a viscous Newtonian fluid, the authors derive equations for the stressed state of liquid. From those, eight rheological constants are determined for equations describing the isothermal motion of an incompressible anisotropic fluid with a constant magnitude structural orientation vector. The ninth rheological constant is found by considering a special case (the absence of external force fields and a negligibly small particle inertia). Rheological equations of state are found by averaging Ericksen's tension tensors over the angular distribution function for the axis of rotation of an elliptical particle, and making use of the rheological constants. As an example, the Couette flow of a polymer solution with rigid ellipsoidal macromolecules in the absence of external force fields and rotational Brownian motion is analyzed. It is found that, in the presence of macromolecular inertia with or without macromolecular Brownian motion, weak polymer solutions of molecules, approximated by a rigid ellipsoid of rotation will exhibit non-Newtonian properties.

## DEONTOLOGY IN THE SYSTEM OF MEDICAL EDUCATION

[Article by F.M. Priduvalov, R.P. Chernyshev, V.A. Abrosimov, Chair of Marxist-Leninist Philosophy, Odessa Medical Institute imeni N.I. Pirogov; Moscow, Sovetskoye Zdравоохранение, Russian, No. 9, 1972, submitted 22 November 1971, pp 66-67]

UDC: 614.253:378.661

Deontology has undergone a specific stage of inception in the system of medical education or, more likely, a stage of initial development, acquiring the status of a pedagogic science. This is typical not only for our U.S.S.R. The discussions on the pages of this Journal reflect understandable concern as to what to do with the "illegitimate child." While there is agreement, in principle, that a Soviet physician must be informed about deontology and that its place in the system of medical education must be "guaranteed," which is also our view, there are special differences between the participants of the discussions which deal with who would do this best and in what pedagogic form.

In the opinion of Professor B.D. Petrov, it would be purposeful to have the course on deontology organizationally attached to the chair of history of medicine. We believe that such an approach would lead to consideration of deontology only in the historical aspect, without sufficient theoretical and philosophical substantiation. This could be reduced to demonstration of a brilliant gallery of outstanding scientists and, to a lesser extent, to disclosure of the moral content of science itself. What is beautiful in the behavior code of physicians, "great and small," could overshadow the objective bases of their moral duty.

At the same time, N.G. Karlsen and I.I. Kosarev believe that deontology must be taught on the chair of social hygiene and public health organization. But this chair has its own tasks, and the spectrum of its medical aspects is limited. So that it could hardly be in a position to solve, by itself, the problem of teaching deontology in the diverse branches of medicine. There are doctrinal distinctions in surgery, internal medicine, obstetrics, gynecology, forensic medicine, and others, so that it would be hardly purposeful to numerate information about deontology on the chair of social hygiene and public health organization.

Published for the purpose of discussion.

"Changes in Renal Function After Exposure to High Ambient Temperatures"

Moscow, Patologicheskaya Fiziologiya i Eksperimental'naya Terapiya, No 2,  
pp 62-64

**Abstract:** Dogs with exteriorized ureters were exposed to the sun's rays or kept in a thermal chamber ( $44$  to  $45^{\circ}$ ) for one hour, after which various indexes of renal function were determined. Overheating significantly reduced renal plasma flow, glomerular filtration, urea clearance, tubular reabsorption of water, and excretion of electrolytes, K in particular (mainly because of decreased glomerular filtration). A comparison of the changes in renal function after the two types of overheating were quantitative rather than qualitative in character. It appears then that the kidneys are actively involved in the compensatory-adaptive reactions to high ambient temperatures. By altering the magnitude of glomerular filtration and tubular reabsorption of water the kidneys save on the water lost in the effort to control hyperthermia while intensifying the excretion of sodium and potassium.

"Prevention of Tickborne Encephalitis in a Large City"

Moscow, Meditsinskaya Parazitologiya i Parazitarnyye Bolezni, No 5, 1971,  
pp 588-591

**Abstract:** The rapid growth of industrial centers in Western Siberia near endemic regions of tickborne encephalitis has increased the incidence of this disease among some urban populations. For example, in Novosibirsk, a city of approximately half a million people located on the Ob River, four cases were reported in 1955, 108 in 1962, and 141 in 1966. The city is located close to a number of densely wooded, heavily tick-infested areas often visited by hikers, vacationers, etc. However, the number of cases was reduced to 74 in 1969 mainly as a result of systematically dusting the forests most frequented by Novosibirsk residents with DDT (30 to 50 kg of 10% dust per hectare) and by selective vaccination of groups most vulnerable to tickborne encephalitis (geologists, regular hikers, etc.). It was not deemed necessary to provide mass vaccinations.

Translation: Results are presented of tensometric investigations of nuclear reactor vessels of powerful atomic electric power plants. The investigations were carried out during the initial period of operation, they made possible an evaluation of developing stresses and temperatures depending on operating conditions. Characteristics of the state of stress and of the temperature change in the vessel in transient and steady state operating conditions are demonstrated. Recommendations based on results of full scale tensometering are given for the selection of operating conditions. Three illustrations, two tables.

X-8. EXPERIMENTAL STUDY OF THE DISTRIBUTION OF THE ADJUVANTS IN MULTILAYERED FILM STRUCTURES OF GALLIUM ARSENIDE GROWN BY THE METHOD OF LIQUID UPTAKE

[Article by A. A. Butybin, A. A. Zokharov, I. V. Kestryeva, N. M. Nedav'ya,  
V. M. Prigorovskiy, Lanturidz, Novoselish, III. Slomozin, no. 10722,  
Dnestrovskaya Poljoprudnitskaya Krasatkov, Pirogov, Rostov, Russia, 1-17 June  
1972, p 136]

This paper contains a discussion of the results of an experimental study of the structure distribution in film structures of GaAs of the n-type, a p-type, and p-n-type and others grown from the melt-solutions under forced cooling and using a temperature gradient. The conditions of epitaxial growth of the films are the following: the saturation temperature of the solution is 800°C; the cooling rate is 1-3 deg/min., the temperature gradient is 2-10 deg/mm. Tin, germanium and zinc were used as the alloying admixtures. The distribution of chalcogenides in the structures obtained was investigated by the known volt-ferad and sonic methods and also using the chemical decoloration procedure developed for Gallium arsenide. The research demonstrated that admixture concentration are obtained between the layers and also structures with intermediate high-resistance and low-resistance layers. It was discovered that when using the temperature gradient method, a more uniform distribution of the admixtures is obtained with respect to the thicknesses of the layers. The measurement results obtained by different methods agree quite well with each other.

PRIGORSKIY, V. A."On the Similarity of Chains of Projectors in Hilbert Space"

V sb. Mat. issledovaniya (Mathematical Research--collection of works), T. 5,  
vyp. 3, Kishinev, Academy of Sciences of the Moldavian SSR, 1970, pp 207-209  
(from RZh-Matematika, No 5, May 71, Abstract No 5B769)

Translation: The following theorem is proved: Let  $\mathfrak{G}$  be an arbitrary bordered chain of projectors,  $\mathfrak{X}$  be an orthogonal chain, and  $\psi(q) = P$  be a mutually single-valued mapping of the chain  $\mathfrak{G}$  on the chain  $\mathfrak{X}$  which preserves order. If there exists a constant  $C (0 < C < 1)$  such that for any bordered partition  $(Q_i)_0^m$  of chain  $\mathfrak{G}$  and arbitrary vector  $f$  the inequality

$$\sum_{i=1}^m \|(\Delta P_k - \Delta Q_k)f\|^2 \leq C \|f\|^2$$

is satisfied, then chain  $\mathfrak{G}$  is similar to an orthogonal chain. Author's abstract.

Translation: Results are presented from tests under laboratory conditions of derivatives of pyrimidine carboxylic acids, methyl and styryl pyrimidines. The majority of the tested compounds are weak insectofungicides. The 2,6-dichloro-4-methylpyrimidine 100% suppresses Alternaria radicina, Aspergillus niger, Fusarium oxysporum, Venturia inaequalis and Helmintosporium. On replacement of the Cl atoms by OH, the fungicidal activity drops significantly; 2-styrylpyrimidine inhibits the growth of fungus mycelium in a concentration of 0.1 and 0.05% by 100%; 4-methyluranyl in a concentration of 1% causes 67% death of houseflies, and 5-bromo-2-methylprimidine, 100%.

"Application of New Optical Microbarometer Type OMB-3P"

Moscow, Geodeziya i Kartografiya, No 4, 1971, pp 45-49

**Abstract:** The OMB-3P is an improved aneroid altimeter for geodesic and geo-physical surveys. Its specifications are: instrument error  $\pm .02$  mb [millibars] at up to 20 mb, 60-80 mb spread without range switching, ocular scale divisions of .03-.04 mb each, weight 3.1 kg, and dimensions 145 x 134 x 300 mm. The instrument can be adjusted for mountain usage for a spread of 400 mb within one range setting, ocular scale divisions of .20 mb and an instrument error of  $\pm .05$  mb. The altimeter is a two-section aneroid unit connected below a spiral-ribbon spring mounted along a vertical axis. The lower end of the spring is immersed in a cylinder containing damping fluid. The upper end of the spring is fixed to a range-setting screw. A rotatable mirror is attached to the center of the spring. An optical system illuminates the mirror (requires an external power source) and projects the angular position of the mirror to the instrument panel to provide a direct measurement of atmospheric pressure in terms of mirror rotation. The entire mechanism is hermetically sealed in a D-war flask except for the intake tube. Two hundred units have been in field use since 1968-1969.

RZh--Elektronika i yeye primeneniye, No 2, February 1971, Abstract No 2B576P)

Translation: A circuit is proposed for control of a 3-phase bridge semicontrolled rectifier [vypryamitel']. The control circuit contains an auxiliary bridge non-controlled rectifier, a relaxation oscillator for triple frequency using a dynistor, 3 auxiliary thyristors, and 3 output pulse transformers. The relaxation oscillator supplies pulses to the gates of the auxiliary thyristors. The anodes of these thyristors are connected with the primary windings of the pulse transformers. The second terminals of these windings are switched in to phases of the voltage for rectifier of the relaxation oscillator. The cathodes of the auxiliary thyristors are connected at a common point and are connected across a resistor to the negative terminal of the noncontrolled 3-phase rectifier. The secondary windings of the pulse transformers are connected with the gates of the power thyristors. 1 ill.

Aluminum Nitrides"

Moscow, Izvestiya Akademii Nauk SSSR, Neorganicheskiye Materialy, Vol 7,  
No 2, 1971, pp 231-233

**Abstract:** A study was made of the effect of high-temperature annealing at 2000°C for 5 to 20 hours on boron nitrides and at 1900°C for 5 to 10 hours on aluminum nitrides. The raw BN powder was obtained by reduction of boron anhydride by carbon in a nitrogen atmosphere. AlN was obtained by nitriding aluminum powder. Chemical stability (interaction with water) before and after annealing, and the change in particles size after annealing were determined. Structural changes during heating were studied by the X-ray method and the results are presented in graphs. It is shown that powders, after annealing at 1600°C, weakly react with water, although a certain increase in particles size and in pycnometric density was observed in BN together with structure ordering. The annealing of BN at 2000°C leads to structure disordering, resulting in deteriorating properties.

"Production of Inert Gases from Engine Exhaust Gases"

Izvestiya Vysshikh Uchebnykh Zavedeniy, Mashinostroyeniye, No 11, 1971,  
pp 111-115.

**ABSTRACT:** This article presents experimental data from studies of a method of producing inert gas media from diesel exhaust gas, plus several calculation dependences characteristic for the method and a comparison of calculated and experimental data. The method is based on direct burning of liquid fuel in a stream of diesel exhaust gases. The operating process involves two stage combustion of the fuel. The first stage is evaporation of the fuel in a four chamber, followed by flame burning of the gaseous products as they mix with a highly vortexed stream of diesel exhaust gases. The study showed the genuine possibility of production of an inert gas medium by this method. The calculation method developed produces results allowing it to be used for further study of the process.

"To the Theory of Gas-Hydraulic Engine Installations"  
Kiev, Gidromekhanika, No 19, 1971, pp 15-24

**Abstract :** The hydro-thermodynamic principles of the theory of the gas-hydraulic reaction engine of high speed vessels with gas-turbine engine in the capacity of generator gas producer are discussed by reference to the schema of a waterjet installation. On the basis of cited correlations, an analysis of the propulsive coefficient is presented with due regard for the principal internal losses of the engine. A formula characterizing the total efficiency  $\eta$  of the waterjet installation is deduced. The effect of a great number of parameters on the value of  $\eta$  is demonstrated and, particularly, the effect of the mixing coefficient is discussed and illustrated. It is concluded that under actual conditions the mixing with outboard water can result in an increase of the pull by up to 1.5-2 times at speeds of up to 50 m/sec. By further increase of speed, the relative gain in pull decreases. Three illustr., 24 formulas, nine bibliog. refs.

"Chemistry of Indole. XXIV. Synthesis of 1-Acetyl-6-methyl-8-keto-2,3,7,8-tetrahydro-1H,9H-1,4-diazepine-[2,3-f]-indole"

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 6, Jun 71, pp 787-788

Abstract: To 1.91 g of 1-acetyl-5,6-diaminoindoline in 50 ml dry xylene, 1.52 ml of acetoacetate in 5 ml xylene is added dropwise with heating. The reaction mixture is heated for one hour with continuous removal of water. After cooling, a solid product -- 1-acetyl-6-methyl-8-keto-2,3,7,8-tetrahydro-1H,9H-1,4-diazepino-[2,3-f]-indole (I) is obtained, which after repeated recrystallization from methanol melts at 223.5-224.5°. Another route to (I) consists of indoline reaction with acetoacetate to form ethyl ester of  $\beta$ -[(1-acetyl-6-aminoindolinyl-5)-amino]crotonic acid, which then reacts with sodium ethoxide to yield (I). Heating (I) in 2N sulfuric acid gives 2-methyl-5-acetyl-6,7-dihydroimidazo-[2,3-f]-indole, m.p. 328-329°.

"Model Investigation of Vertical Distribution and Production of Phytoplankton"  
Kiev, Gidrobiologicheskiy Zhurnal, No 2, Vol 7, Mar/Apr 71, pp 5-10

Abstract: The article describes a mathematical model for vertical distribution and production of phytoplankton on a digital computer. Input information consists of water surface illumination, water temperature distribution by depth and with time, and the initial concentration of biogenic elements. The investigation produces a dynamic picture of phytoplankton production in the total water supply, as well as the vertical distribution of phytoplankton biomass and biogenic concentration conforming to direct observation data on these factors.

"On Approximate Calculation of Flow Parameters at Interaction of Supersonic Jets"

Moscow, Izvestiya Akademii Nauk USSR, Mekhanika Zhidkosti i Gaza,  
No 1, Jan-Feb 73, pp 168-170

Abstract: A study was made of an approximate method of calculation of the parameters of a compound air jet outflowing from four nozzles with interaction of individual jets on the initial gas-dynamic section. Considered is an outflow into a flooded space at subcritical flow conditions with associated interference shock wave. A calculation schema is presented for the coefficient of losses in total pressure as the gas moves through shock waves developing by interaction of jets. The distribution of the Mach number on the axis of the compound jet is evaluated. The comparison of experimental and calculated data shows a sufficient coincidence. Two figures, six formulas, three bibliographic references.

DESCRIBES A HOPPER LEVEL GAUGE IN USE IN A REFRACOTRY MATERIALS FACTORY WHICH OPERATES SATISFACTORILY WITH MATERIAL HAVING A UNIT SIZE OF UP TO 10 MM AND A MOISTURE CONTENT OF UP TO 12PERCENT AT AMBIENT TEMPERATURES BETWEEN 0 AND 25DEGREESC. IT CONSISTS OF A PROBE, A SUSPENSION SYSTEM, A FAN AND A POTENTIOMETER. THE PROBE COMPRIMES TWO LENGTHS OF RUBBERTIZED CORD FABRIC PLIES BOLTED TOGETHER AND WITH SOME OF THE CENTRE PLIES REMOVED TO FORM TWO DIAPHRAGMS. A HIGH RESISTANCE WIRE SPIRAL IS WOUND ROUND ONE OF THE DIAPHRAGMS OVER ITS WHOLE LENGTH, AND THE CHANGE IN RESISTANCE IN THE SPIRAL WHEN THE MATERIAL IN THE HOPPER PASSES THE TWO DIAPHRAGMS TOGETHER ACTS AS THE OUTPUT SIGNAL OF THE GAUGE. THE FAN CREATES A PRESSURE OF 10-15 MM HGT. COL. INSIDE THE PROBE TO MAINTAIN THE SPACE BETWEEN THE DIAPHRAGMS WHEN THEY ARE UNLOADED.

"Satisfaction of Technological Requirements for Modern Heating Furnace Designs"

Metallovedeniye i Termicheskaya Obrabotka Metallov, No 9, 1973, pp 34-36.

**Abstract:** Requirements placed on heating furnaces include: maintenance of the required temperature mode with minimum deviations; sealing of the heating space in order to allow controlled atmospheres to be used; capability of direct quenching of parts with regulated temperature or cooling in a protective medium; and maximum automation of the control of all elements of the technological process. Designs of modern furnaces meeting these requirements, primarily manufactured in the USA, Japan, Britain and West Germany, are very briefly described.

"γ -Radiation of  $^{65}\text{Ga}$ "Moscow, Izvestiya Akademii Nauk SSSR -- Seriya Fizicheskaya, Vol XXXV, No 8,  
1971, pp 1575-1581

Abstract: Using a Ge(Li)-detector with a sensitive capacity of  $\sim 33$  cubic centimeters, the authors studied the gamma-ray spectrum of  $^{65}\text{Ga}$  ( $T_{1/2} = 15.2$

minutes). They used the accelerator at the Laboratory of Nuclear Reactions, Joint Institute for Nuclear Research, with boron ions having an energy of 40 million electron volts. Although the authors selected the reaction

$^{56}\text{Fe}(^{11}\text{B}, 2n)^{65}\text{Ga}$  as their source of  $^{65}\text{Ga}$  because it does not produce very large admixtures of the undesirable  $^{66}\text{Ga}$ , they did not succeed in eliminating  $^{66}\text{Ga}$  completely. In a number of cases this made it more difficult to identify weak lines in the region above 800 kilo electron volts. The authors succeeded in determining the energies and intensities of 24 γ-lines; 21 of these lines were associated with the disintegration of  $^{65}\text{Ga}$ . They also computed the intensities of the gamma rays in percents of disintegrations. Finally, they compared their results with those cited in several other articles on the same topic, discussing the similarities and differences in some detail.

"Ge<sup>66</sup> Decay"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, Vol. 34, No. 1, Jan 70,  
pp 29-41

**Abstract:** The  $\gamma$ -spectrum of Ge<sup>66</sup> was measured with a Ge(Li) detector with sensing volumes of 5 and 9 cm<sup>3</sup> and a 4096-channel analyzer. All lines observed by Ricci, et al were observed except the  $\gamma$ -line 405 kev. In all, 44 lines were observed, of which 26 were definitely established as belonging to Ge<sup>66</sup>. The intensities of Ge<sup>66</sup>  $\gamma$ -rays were determined on the basis of the ratio of the intensities  $\gamma$  381 (Ge<sup>66</sup>)/ $\gamma$  1039 (Ge<sup>66</sup>) as measured in given time intervals and the known intensity of  $\gamma$  1039 in % decays. A level diagram was constructed for Ga<sup>66</sup>. The quantum characteristics of Ga<sup>66</sup> levels are discussed.

ABSTRACT/EXTRACT—(U) GP-0— ABSTRACT. THE LOW HEAT RESISTANCE OF POLYMERS RESTRICTS THEIR APPLICATION AS ANTIFRICTION MATERIALS AT FRICTION NODES OF MACHINES. RECENTLY A NUMBER OF HEAT RESISTANT POLYMERS HAS BEEN DEVELOPED, WHICH RETAIN THEIR BASIC PROPERTIES AT 250-300DEGREES C AND HIGHER. AMONG SUCH MATERIALS ARE AROMATIC POLYAMIDES, A REPRESENTATIVE OF WHICH IS FENILON, ITS VITRIFICATION TEMPERATURE IS 280DEGREES C. IT IS PROCESSED BY PRESSING INTO A PLASTIC WITH SUFFICIENTLY HIGH PHYSICAL AND MECHANICAL PROPERTIES. AN INVESTIGATION WAS MADE OF THE ANTIFRICTION PROPERTIES AND HEAT RESISTANCE OF FENILON UNDER CONDITIONS OF NORMAL AND INCREASED TEMPERATURES FOR VARIOUS FRICTION CONDITIONS IN ORDER TO DETERMINE THE POSSIBILITIES OF ITS APPLICATION IN FRICTION NODES OF MACHINES. FENILON MANIFESTED A COMPARATIVELY SMALL AMOUNT OF WEAR UNDER TEMPERATURE CONDITIONS IN WHICH LESS HEAT RESISTANT POLYMER PLASTICS CANNOT FUNCTION. IN SPITE OF THE INCREASED WEAR WITH A HIGHER TEMPERATURE, THE SAMPLE REMAINED HARD, WITH NO SIGNS OF VOLUMETRIC DEFORMATION, OR OTHER SYMPTOMS OF HEAT DAMAGE. THE CONDUCTED TESTS INDICATE THAT FENILON CAN FIND APPLICATION AS A MATERIAL FOR FRICTION NODES OF HEAVILY LOADED MACHINES.

"Inverse Problems of Generalized Magnetic Potentials"  
Minsk, Differentsial'nyye Uravneniya (Differential Equations), Vol VI, No 1,  
1970, pp 27-38

Abstract: A unique solution is sought for the inverse problem of a generalized magnetic potential representing the sum of the potentials of distributed masses by means of a general linear elliptical operator of the second order with variable coefficients. The fundamental integral functionals are given and used to prove the necessary and sufficient conditions of equality for the magnetic moments of two bodies with variable densities. These conditions are then extended to the case in which the external and internal magnetic potentials are simultaneously equal.

A general theorem is proved for the unique determination of the shapes and densities of the two bodies. The generalized potentials and densities are

"Proton Beam With an Impulse of Up to 70 Gev/s Elastically Dispersed Inside a Target"

Leningrad, Zhurnal Tekhnicheskoy Fiziki, Vol. 42, No. 7, 1972, pp 1437-1445

Abstract: This paper discusses the operation of a channel built into the French liquid-hydrogen Mirabelle chamber for the accelerator of the Institute of High-Energy Physics (IFVE). The function of the channel is to form pure beams of pi and k mesons, and antiprotons, in a broad range of impulse magnitudes under the action of a high-frequency separator. The secondary particles are generated on the inside of a target placed in the path of a proton beam diverted from the accelerator with an energy of 70 Gev. By using a fast system for aiming the proton beam at the target, together with a kicker magnet in the channel, the required number of particles passing through the chamber can be provided. The optical system of the channel is described with the

"Negative Particle Channel With Momentum up to 60 Gigaelectron  
Volts/Second"

Moscow, Atomnaya Energiya, Vol 29, No 1, Jul 70, pp 29-34

**Abstract:** This article contains a description of a channel for transporting negative particles generated in an internal accelerator target with momentum up to 60 fifaelectron volts/second and an accelerated proton energy of 70 gigaelectron volts. The channel is designed so that for an accelerated proton energy of 70 gigaelectron volts it can be adjusted to momentum in the range of 40-60 gigaelectron volts/second. On reducing the energy of the accelerated protons, the channel can be adjusted to lower momentum. The lower limit corresponds to an accelerated proton energy of 20 gigaelectron volts and is equal to 11.4 gigaelectron volts/second.

The optical system of the channel and its characteristics

USSR

ALEKSANDROV, I. A., et al., Atomnaya Energoja, Vol 29, No 1,  
Jul 70, pp 29-34

are presented. The limiting solid capture angle of the secondary particles by the channel is 32 microsteradians. The best resolution with respect to momentum is 0.3 percent without decreasing the pature angle. The channel was investigated primarily using a secondary beam with a momentum of  $p = 50$  giga-electron volts/second. The procedure for adjusting the channel and the calculated data are described. The differences between the calculated operating conditions of the elements and the conditions after adjustment together do not exceed the errors of the fringing field of the accelerator, the magnetization curve, and the curve for calibrating the bypasses of the magnet. On the whole, the beam parameters agree well with the calculated data.

A detailed diagram of the channel layout is presented, and graphs are presented for the radial position of the targets and the production angle as functions of the momentum of the secondary particles, the optical system of the channel and path of the beams in the horizontal and vertical planes, the momentum

"Concerning the Solubility of the Inverse Problem of a Volumetric Potential of Variable Density for a Body Close to a Given One"

Moscow, Sibirskiy Matematicheskiy Zhurnal, No 6, 1970, pp 1321-1332

Abstract: In the article is presented a solution of the inverse problem of methaharmonic potential in the following formulation: there is sought the body  $T_1$ , such that its external metaharmonic potential ( $\chi = 0$ ), of a given variable density  $\mu$ , is equal outside the body  $T_1$  to the given metaharmonic function  $H$ ; function  $H$  diminishes at infinity as the metaharmonic potential and is close, in the sense of a certain functional matrix, to the external metaharmonic potential  $U(x; T, \mu)$  of the given body  $T$  of variable density  $\mu$ . The existence and the uniqueness of the solution of the indicated problem is proved, and the method of actually finding it is given. 10 bibliographical entries.

"Direction of Quaternization of Six-Membered Nitride Heterocycles Containing the Dialkylaminophenyl Radical"

Kiev, Ukrainskiy Khimicheskiy Zhurnal, Vol XXXVIII, No 6, 1972, pp 589-594

**Abstract:** It is known that the cause of the chromaticity of pyridine and benzo-pyridine salts is frequently the formation of complexes with charge transfer [E. M. Kosover, Novyye problemy fizicheskoy organicheskoy khimii, Mir Press, Moscow, 36-94, 1969]. Accordingly, the conclusions of D. I. Gamaise, et al. [Chem. and Ind., 1645, 1967] were checked on various six-membered heterocycles containing the n-dialkylaminophenyl radicals in the  $\alpha$  and  $\gamma$  positions. Thus, a study was made of the direction of quaternization under various conditions of bases (I) and also 2-n-dialkylaminophenyl quinolines (II), 2-(1'-alkyl-1',2',3',4'-tetrahydroquinolinyl-6')-quinolines (III) and 9-n-dialkylaminophenylacridines (IV). In the reaction of 2-n-dialkylaminophenylquinolines and their analogs with alkyl halides at 80-150°, the following quaternary salts were obtained: 4-(n-dialkylaminophenyl)-pyridinyl, 2(n-dialkylaminophenyl)quinolinyl, 1-methy-6-(quinolyl-2')-1, 2, 3, 4-tetrahydroquinolinyl, 9-n-(dialkylaminophenylacridinyl). Substitutions are presented for the ring R' and the extraring nitrogen atom R and the anions X. Synthesis procedures, physical and chemical characteristics and yields are presented for eight compounds.

"Effect of Diffusion Due to Heating on the Strength of Joints Between Layers of Bimetals"

Moscow, Izvestiya Vysshikh Uchebnykh Zavedeniy, Chernaya Metallurgiya, No 1, 1971, pp 101-105

**Abstract:** The primary difficulty in producing and working with steel+aluminum, steel+titanium, aluminum+copper, and other bimetals is a decrease in tensile strength and a greater scatter in tensile strength data following the heating of these bimetals or their exposure to a higher temperature on welding the layers. Described here is a model based on the coagulation of excess vacancies in the weld-metal zone. The model is designed to explain the above changes. Use is made of a relationship between relative strength ( $0 < \delta > 1$ ) and temperature and heating duration. The results of a microfractographic study conducted in parallel are in agreement with the model for measuring the strength of the bimetal. It is suggested that the reduction in strength and the lamination of the dissimilar metals is due to supersaturation with diffusible vacancies in the contact area.

"Magnetostrictive Transducer For Delay Lines"

USSR Author's Certificate No 296154, filed 25 Feb 69, published 9 Apr 71  
(from RZh:Radiotekhnika, No 2, Feb 72, Abstract No 2G241P)

Translation: A magnetostrictive transducer for a delay line is proposed, which contains a winding with a few loops connected with an acoustic line, a matching transformer, and an acoustic damper. With the object of an increase of the product of the transmission coefficient by the power in the band of the frequencies being transmitted, the transducer winding is made in the form of two adjacent sections situated at the acoustic line and connected across the corresponding matching transformers into the circuit of an electromagnetic delay line. In order to decrease the dissipation inductance and widening of the band of the frequencies being transmitted, the step-down windings of the transformers are made in the form of cylindrical rods with a diek bulge [utolshchenyy] in the middle part and with the cores of the step-up windings at the ends placed in cup-shaped cavities connected electrically with the ends of the rod, and in so

1/2

SR

TRIFONOV, V. V. et al, USSR Author's Certificate No 296154

doing a section of the winding of the transducer is connected between the edge of each cup-shaped cavity and the disk. With the object of increasing the efficiency, sections of the winding are made in the form of solenoids and each section -- in the form of two adjoining coils of an insulated wire, the diameter of which is equal to the internal diameter of the solenoid. The alignment of the acoustic line in the latter is accomplished with the aid of bushings /vtulka/ located at the ends of the winding, and the transformer, magnet, and acoustic damper are attached to a common housing.

"Sum and Difference Radiation Patterns with Minimum Fringe Radiation"

Moscow, Radiotekhnika i Elektronika, Vol XV, No 7, 1970, pp 1374-1384

**Abstract:** This article contains an investigation of sum and difference radiation patterns of linear and circular apertures with minimum fringe radiation or with maximum proportions of power within the limits of the main lobe. The solution is presented in terms of spheroidal functions the asymptotics of which made it possible to obtain analytically simple expressions both for the radiation patterns and for the amplitude distribution.

Significant improvement in the structure of the fringe radiation is achieved when building antennas with radiation patterns which are optimal in the sense of maximum radiated power within the limits of the main lobe or minimum fringe radiation. When solving problems related to this concept as applied to sum and difference radiation patterns of linear (rectangular with separating amplitude distribution) and round apertures, the solutions obtained are compared, and patterns close to optimal described by expressions of the type

MINKOVICH, B. M., et al, Radiotekhnika i Elektronika, Vol XV, No 7, 1970, pp 1374-1384

$\Lambda_{1/2}(\sqrt{v^2 - B^2})$ , which can be especially useful in engineering practice, are found. Fourier and Hankel transformations from the amplitude-phase distribution are used to express the patterns. Graphs of the difference functions and quasioptimal patterns of the round aperture and the corresponding amplitude distributions are presented for values of B from 0 to 5.
